

WORLD'S FINEST SAWS

🇯🇵 **MADE IN JAPAN - SINCE 1919**

THE STORY OF SILKY

It is 1919. In the heart of the Japanese Ono region the clang of hammering from blacksmith Katsuji Miyawaki echoes on the surrounding mountains. The first Silky saw is born.

A hundred years later, the third generation Miyawaki forges saws of unrivalled quality. The hammers have evolved into the most modern, patented techniques - the passion and dedication remain.

From arborist high in the tree to gardener in the backyard. From bushcrafter deep into the forest to furniture maker in the workshop. Worldwide, many enthusiasts rely on the pull saws of Silky.

PAGE 110 - 113

SAWS LISTED

PAGE 114 - 119

NON-SET TEETH

The teeth are ground in the blade with precision, each with 4 cutting surfaces. The teeth are “non-set” (in compare to a classic Western saw), so that the cutting surface cuts straight into the wood, and destroys about 50% less wood cells in the process. The blades are ground biconcave: the bottom part of the blade is thickest, the top part slightly thinner and the blade is thinnest in the middle.

INDUCTION HARDENED

The tips of the teeth are heated up to a very high temperature for a split second. As only the tip (or in other words the cutting part) of the tooth is heated, the rest of the tooth keeps its cutting quality but also its flexibility. Induction hardened teeth have a lifespan of three times that of non-treated teeth, but they cannot be sharpened.

ARBOR COMPOSITE GRIP

This handle is made of an environmentally friendly composition, containing 70% wood powder. The arbor composite handle gives a warm and comfortable touch and superior control. The feel is a bit harder than the usual GOM rubber handle, but it offers more grip with greasy substances. Exclusively applied to the folding saws of the Outback series.

BLACK COATING

A unique nickel and tin blend has been applied to all blades of the Outback foldings saws. The dark, non-reflective color is particularly suitable for tactical operations. This coating provides a long blade life and an incredible cutting performance.

NICKEL COATING

The advantage of nickel is that this material pours well into the edges. Therefore, the nickel coating is equal all over the blade and that ensures a smooth surface and less material wastage. The nickel plating is applied after the teeth are ground into the blade. In doing so, the teeth will remain sharp for a long time and are protected against rust.

CHROME COATING

The chrome plating on the saw blade makes the surface of the blade extremely hard and longwearing, while reducing frictions and increasing the lifetime of the blade. Furthermore, the chrome plating protects the blade against rust. Before applying the chrome plating, Silky polishes the blade as smooth as silk. This makes that the blade encounters even less resistance in the wood while sawing.

RUBBER JACKET

A rigid, aluminum frame covered with rubber provides a light and comfortable grip. The rubber jacket is applied on all saws in the Ultra Accel series. The handle prevents slipping and absorbs vibrations.

SHARPENABLE

When the teeth are not induction hardened, they can be sharpened with the special Silky file. Check www.silky-europe.com for an overview of all saws that can be sharpened and for instructions on how to file a Silky saw.

GENKI GRIP

A number of Silky saws and axes / machetes are equipped with the unique Genki grip. This grip consists of two parts that can be zipped off the blade and placed on a new one without the use of tools. The rubber Genki grip absorbs the sawing vibrations to a maximum as no screws or bolts are attached that could guide the vibrations. The Genki grip offers a superior grip, even in wet conditions or while wearing gloves.

“GOM” HANDLE

The GOM rubber handle absorbs sawing vibrations and offers a superior grip, even in wet conditions or while wearing gloves. Moreover, this handle always feels comfortably warm, even in extremely cold temperatures.

3D-ROLLER

The three rollers provide a smoother action when inserting the saw in the scabbard from any angle. The tri-roller system includes a locking mechanism that prevents the saw from accidentally falling out.

PROGRESSIVE TEETH

A progressive teeth configuration means that the teeth closest to the handle are slightly finer to facilitate the first cut. Towards the end of the blade, the teeth become coarser so you can rip through the wood at high speed.

4-RETSUME

Silky saws with 4-RETSUME teeth belong to the category of fastest handsaws on the market and are very well suited for the toughest jobs. The teeth are ground in such a way, so that every 4 teeth in a row form one combination. This does not only leave a very smooth tree wound, but also enables a perfect discharge of sawdust.

MIRAI-ME

The unmatched patented MIRAI-ME technology makes it possible to use the saw for 3 types of sawing: crosscutting (perpendicular to the grain), rip-cutting (parallel to the direction of the grain) and diagonally. This unique teeth design gives that Silky smooth finish to the wood.

BLACK OXIDE COATING

This coating has been applied to the new Nata Outback. Through a special oxidation process, the blade gets its deep black color, which is particularly suitable for tactical operations. Silky's Black Oxide offers extra protection against rust for the best chopping performance.

THE SILKY TECHNIQUE

@KAIBRANSS

SILKY TECHNIQUE

Silky saws are designed to cut on the pull stroke. At the first stroke you place the pull saw so that the teeth closest to the handle grab the wood first. After the first pull stroke you slide the saw back to the starting position by a soft push stroke (without force). During the pull stroke the thin blade will not bend because there is no lateral tension. The blade just follows the cut.

If the saw ever gets caught, never push hard or wrench, this may lead to lateral tensions which can damage or brake the blade. Always lift the weight off the blade to release the saw.

The Silky saw guarantees a fine kerf and requires little force. Do not burden, just let the saw do the work. You will feel less tired and it lengthens the life of the saw.

STEP 1 PLACE

STEP 2 PULL

STEP 3 SLIDE FORWARD

SAW MAINTENANCE

Treat your saw with love.

The blade must be kept clean, otherwise the cutting action will be lost. Resin dissolves in olive oil, which is an effective and environmental friendly way to maintain the blade with. Be aware that if you use more aggressive liquids it can damage the rubber material of the handle.

When not using the saw, make sure it is dry at all times. Store the saw in its scabbard in a dry place.

Keep out of reach of children.

SHARPENING THE TEETH

Teeth that are not induction hardened, can be sharpened with the Silky file. Check the packaging for the file icon. The teeth of a Silky saw are ground in 4 angles. These angles also vary by saw, so the filing is very precise. First start filing the teeth at the surface ①, then finish with the top surface on the tips ②. For the optimal result, file along the surface a few times. Only use pressure on the forward stroke, as indicated by the arrows.

For saws with chrome coating, you can recognize the not induction hardened teeth by the absence of the black tips on the teeth. For saws with nickel coating, keep in mind that the harder layer (2 mu) first must be filed away.

HOW TO CHOOSE

STEP 3 STRAIGHT OR CURVE

Traditionally, a straight blade is for all work between your knees and shoulders, while a curved blade is better for working below your knees or above your shoulders. A straight blade can be more precise, but many people find a curved blade bites more aggressively into the wood.

STRAIGHT

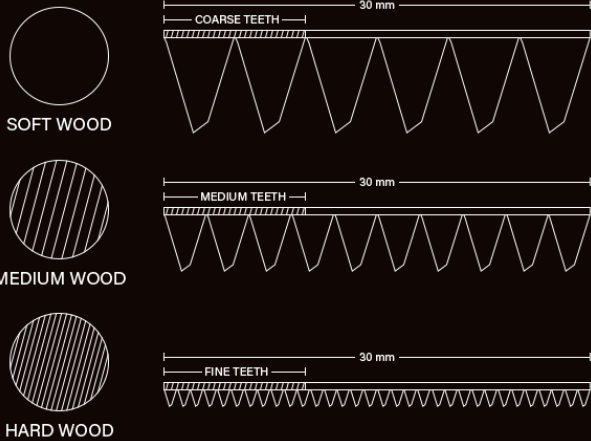

CURVED

STEP 1 FIXED OR FOLDING

Fixed saws are mainly used for bigger jobs. The blade is mostly full tang and runs through the handle, which makes the saw extremely strong.

Folding saws are lightweight and compact, which make them easy to store and to carry with you.

STEP 2 TEETH SIZE

Teeth size directly corresponds with certain kinds of wood. Large teeth (indicated by smaller numbers, such as 6 teeth in 30 mm) rip rapidly through fresh wood, but will have a harder time in dry or hard wood. Fine teeth, in the 13-32 teeth per 30 mm range are suited for hard wood. Medium teeth, like 10 teeth per 30 mm is a good compromise, enabling the teeth to handle anything with a minimum speed loss.

STEP 4 BLADE LENGTH

Divide the blade length by two and you know the maximum diameter of wood you can saw with that blade.

For example, a 24 cm blade will saw up to 12 cm in diameter branches with ease. When sawing larger diameters with that blade, you will notice that you have little capacity to make good strokes.

THE FIXED SAWS

A fixed saw is an essential piece of equipment for arborists and professional gardeners worldwide. In many cases, it is more efficient to use a powerful hand saw over a chainsaw. A fixed saw is lightweight and compact for easy carrying and there is no oil, gasoline, noise or pollution involved. Silky's teeth design makes it possible to saw at high speed and leave behind a smooth and clean cut at the same time.

All fixed saws include a durable scabbard in which the saw is well secured and can be attached to your belt or harness. The saw can still easily be taken from the scabbard with just one hand.

When you are in doubt between a fixed or a folding saw, ask yourself what you find more important: solidity or compactness. The blade of a fixed saw is mostly full tang and runs through the handle, giving you more strength and control over the blade. That is why a fixed saw is mainly used for bigger jobs.

THE GOMTARO

The blade design of the Gomtaro makes this saw perfect for formative pruning in a tree's early years. With the straight blade you can work very precisely and leave behind a smooth and clean cut.

The Gomtaro with large teeth of 8 teeth per 30 mm can be recognized by the red bolts on the handle. The large teeth accel in fresh and soft wood.

The Gomtaro with fine teeth of 13 teeth per 30 mm can be recognized by the silver bolts on the handle. The fine teeth are suited for seasoned or hard wood, like most fruit trees.

The Gomtaro Root also has silver bolts, but has large teeth that are double hardened. This makes the saw extra resistant in rough conditions, like cutting roots.

The full tang blade of the Gomtaro runs through the handle for precise control.

THE GOMTARO SPECIALIZED

THE GOMTARO SPECIALIZED

The Gomtaro Pro-Sentei is based on the Gomtaro, but has several key features that make this a stand out saw. The fine teeth at the end of the blade are ideal to cut small twigs, so you do not have to switch that often between your saw and secateurs anymore. These fine teeth can also be used to make an undercut or to start the cut, after which you can saw rapidly through the wood with the larger teeth on the blade.

Another special edition is the Gomtaro Nidangiri. It has an extra row of teeth (with medium teeth) on the upper side of the blade. Without turning your wrist, you can make an undercut so that the bark does not tear off when the branch falls.

THE TSURUGI

@ CLIMBERGIORGIO

THE TSURUGI

The Tsurugi is characterized by the narrow blade, an ingenious design that enables precision without sacrificing performance.

The combination of the rigid straight blade and the revolver-style handle is ideal for precision work. With the narrow blade of this saw, you will be capable of meticulous pruning in the most densely grown spaces, without damaging surrounding branches.

The Tsurugi with large teeth is identified by the red handle and is designed for fast cutting in fresh wood. The Tsurugi with medium teeth can be recognized by the yellow handle and is intended for a mixture of both fresh and dead wood.

Both versions are available in three different blade lengths. The comfortable Genki grip can easily be zipped of the blade and absorbs vibrations.

THE TSURUGI CURVE

The Tsurugi Curve is characterized by the narrow blade, an ingenious design that enables precision without sacrificing performance.

The combination of the rigid curved blade and the revolver-style handle with Genki grip is ideal for work above the shoulder and below the knee. With the narrow blade of this saw, you are capable of working with precision in the most densely grown spaces, without damaging surrounding branches.

The Tsurugi Curve is available with large or medium teeth and has a choice of different blade lengths. In some sizes, the curved scabbards are available in both right (silver stripes) and left (gold stripes) handed versions. All saws can of course be used by left and right handed people alike.

THE ZÜBAT

THE ZÜBAT

The Zübat is everything you could wish for in a pruning saw. A versatile, powerful pull saw to be used for both precision pruning and for larger removals.

This saw is characterized by its aggressively curved blade with large teeth of 7.5 per 30 mm. The tip of the blade is designed to keep the saw in the cut. The full tang blade gives stability and strength to the full length, while the comfortable GOM rubber handle absorbs vibrations.

The Zübat is available in 5 different blade lengths. The most popular one is the Zübat 330, which can handle thick branches up to 17 cm in diameter. This model is also available with finer teeth of 10 per 30 mm and can be recognized by its silver colored bolts.

THE ZÜBAT ARBORIST

@TRADOCHSAKERHET

THE ZÜBAT ARBORIST

The Zübat is the most widely-used handsaw by arborists all over the world. That is why Silky designed a special version to truly meet all the needs of a tree specialist.

The Zübat Arborist has the same features as the standard Zübat, but has an extra large teeth configuration for even faster cutting in fresh wood. Like every other Silky saw, the teeth will stay sharp, even with frequent intense use and leave behind a smooth cut.

You can recognize the Zübat Arborist by its shiny chrome bolts on the GOM rubber handle.

PRIMARILY INTENDED FOR:

ZÜBAT ARBORIST EXTRA LARGE TEETH

THE GUN-FIGHTER

THE GUN-FIGHTER

This iconic saw has a slightly curved blade with progressive teeth from 8.5 to 6 teeth per 30 mm. Progressive teeth help you to make the first cut with the finer teeth close to the handle, while the larger teeth at the end of the blade ensure maximum cutting speed.

The revolver grip gives a great feeling while sawing. The steel is covered with GOM rubber to reduce vibrations and provide a superior grip that always feels warm, even in cold and wet conditions.

There are 3 blade lengths available in the Gun-fighter series: 270, 300 and 330 mm. Choose the blade length that is maximum double the diameter of the branches that you want to saw.

THE NATANOKO 60

The strong saw blade of the Natanoko is very rigid, due to the high back, and has extra-large teeth to rip through thick tree trunks effortlessly. The large 7.5 teeth per 30 mm rip through fresh wood. Although the teeth remain sharp for a long time, they can be sharpened with the Silky file.

The big rubber handle absorbs vibrations, offers grip, and feels comfortable. The blade can be replaced within seconds by turning the rotary knob on the handle. No tools necessary.

The scabbard has been designed in such a way, so that the saw will not fall out, even when you are in difficult positions while climbing. As soon as you need the saw, you can pull it out of its scabbard easily with just one hand, by pressing your thumb on the button on the side.

THE SUGOI

@KAYLASCENDER

@COFFEEFUELLEDWOODSMAN

THE SUGOI

Sugoi literally means 'exceptionally good'. Because of its aggressive teeth and orange stripes on the handle, arborists nicknamed this saw 'Tree tiger'.

There are three different blade lengths available: 330, 360 mm and 420 mm. All models feature an extra-strong 1.9 mm thick blade. The curved blade, made of high-alloy steel, has a progressive teeth configuration. The smaller teeth 'bite' the wood better at the first cut, after which the larger teeth will rip through the wood at high speed.

The comfortable rubber-molded handle absorbs vibrations and offers lots of grip, even when wearing gloves and under wet and cold conditions. The yellow scabbard is well visible and can be attached to your harness or to your leg with the provided leg straps.

PRIMARILY INTENDED FOR:

THE SUGOWAZA

@TROISFEUILLESELAGAGE

THE SUGOWAZA

The Sugowaza was primarily designed for line-clearance workers wearing rubber insulated gloves. In addition to all the characteristics of the Sugoi, this pull saw has an extra cross-guard to prevent the users' gloved hand to slip off the handle. The comfortable ribbed rubber handle offers lots of grip, absorbs vibrations and always feels warm to the touch.

The long blade of 420 mm enables you to reach further and makes it easy to cut those extra couple branches. Even the 'big' tasks, such as tree removals or sawing thick trunks, are no problem for the Sugowaza due to its progressive teeth. Besides, the perfectly curved blade is made of a special metal alloy that makes the blade strong and flexible at the same time.

The orange scabbard is well visible and can be attached to your harness.

THE IBUKI

THE IBUKI

A true winner on the side of aggressiveness and speed. The large teeth, of 5.5 teeth per 30 mm, combined with the curve make for an extremely aggressive bite into the wood and high speed sawing through fresh wood.

While working above the shoulder and below the knee, you can still saw on top of the branch with the curved blade while your arm, wrist and hand maintain their natural position. Do you sometimes prune from the ground? Then the blade of the Ibuki can be used on the Hayauchi pole saw as well.

The comfortable handle of the Ibuki offers the grip, power and flexibility that you need to handle this saw. The handle is big enough to be used with two hands for the tougher jobs. The scabbard can be attached to your harness, for both right-handed and left-handed people. Additionally, the scabbard has been designed in such a way so that the saw will not fall out of it.

THE GENKI TEMAGARI

@WOODSMANS_FINEST

THE GENKI TEMAGARI

Silky's fastest ever saw! Thanks to the long blade with extra-large teeth, you can effortlessly saw through the thickest branches, beams, or tree trunks. This makes this powerful pull saw more suitable for heavier tasks like felling trees and cutting in pieces than actually pruning them. You will be amazed at how quickly the saw rips through the wood!

It may take some practice and patience to make the first cut with the Genki Temagari. Due to its progressive teeth ratio (from 5 to 3 teeth per 30 mm), the teeth closest to the handle are finer than those near the end of the blade, which makes the first cut a little easier. Once this saw gets going, it is unstoppable!

The long blade is full tang, making this saw incredibly strong and offers you more control. The Genki grip has no bolts or screws, which absorbs vibrations and can be loosened without needing tools.

THE HIBIKI RYOBA

THE HIBIKI RYOBA

The Silky Hibiki Ryoba is a saw developed for fine woodworking, e.g. for cabinetmaker use.

The blade is 21 cm long and has two different kinds of teeth at the upper and lower side of the blade. One is intended for rip-cutting, the other for cross-cutting (22 teeth per 30mm). It has the traditional Ryoba handle.

The smooth Silky pitch makes that the wood does not splinter and results in a beautiful finish. Many different types of cuts can be made with this multi-purpose saw, dovetail, joints and others, without having to change saws. The flexible blade allows for perfect flush cuts. The saw is very well balanced and is supplied with a case, so it can be stored securely and can also be hung on the belt.

THE FOLDING SAWS

Folding saws are lightweight and compact, which make them easy to store and to carry with you. The most compact folding saws can even be taken in your pocket. Therefore, folding saws are very popular for camping, bushcraft and gardeners or constructors who always want to have a saw at hand.

When not using the saw, the blade can be easily folded with the locking mechanism and the sharp teeth will be safely covered in the handle. Many folding saws have two different blade positions for various applications.

Although Silky's folding saws are prized for their small dimensions, they give great performances too! The razor-sharp teeth cut rapidly through the wood and the comfortable rubber handle provides a good grip.

THE POCKETBOY LARGE

The Pocketboy family is versatile, but always compact. The compact size means it is easy to slip in a pocket and take it anywhere. The comfortable GOM rubber handle absorbs vibrations and has a hole for attaching a rope or carabiner to the saw. The blade can be locked into two different positions and folds safely in the handle when the saw is not in use.

The Pocketboy with red handle has a large teeth configuration of 8 per 30 mm. These large teeth rip through fresh wood with maximum speed, while still leaving behind Silky's signature smooth cut.

The Pocketboy with black handle is a true all-rounder. They feature medium teeth at 10 teeth per 30 mm. Medium teeth can handle anything you throw at them, from fresh wood to hard and dead wood.

PRIMARYLY INTENDED FOR:

POCKETBOY LARGE TEETH

THE POCKETBOY FINE

THE POCKETBOY FINE

The blue Pocketboy represents fine teeth, created for hard or dry wood. With 20 teeth per 30 mm, this saw is most suited for carpentry projects or working exclusively with hard or seasoned wood.

The purple Pocketboy represents Silky's extra fine teeth for woodworking. The 26 teeth per 30 mm leave behind extra smooth cuts.

The locking mechanism on the handle makes it possible to use the saw in two positions. The second position raises the handle to make it easier to saw on a flat service. The straight blade has a thin kerf, enabling extreme precision. Fold the blade into the handle to safely store it and capitalize on the compact nature of the Pocketboy family.

PRIMARILY INTENDED FOR:

THE POCKETBOY CURVE

The yellow Pocketboy represents Silky's curved blades. The large teeth rip through wood with great speed and leave behind smooth cuts. The curved blades bite into wood and are great for working above your shoulder or below your knee.

The Pocketboy family is designed to be very compact, while never sacrificing quality. Fold the blade into the handle to safely store it. Then slip it in your pocket or hang it from your belt with a rope or carabiner, so this saw will travel everywhere with you.

There are two blade lengths available, 130 mm and 170 mm. Larger sizes are suited for larger branch diameters. A good rule of thumb is the blade can handle branches of half the blade length in diameter.

THE F180

The F180 is known for the lightweight polypropylene handle with a section of GOM rubber to absorb vibrations. A compact folding saw with a 180 mm long blade to easily cut branches up to 90 mm in diameter. Although they are favorably priced, they do not sacrifice any of the quality you expect in a Silky saw.

Fold the blade into the handle to protect the teeth. The hole in the handle is perfect for hanging it from your belt with a piece of rope or a carabiner.

There are two teeth options available. The large teeth at 7.5 teeth per 30 mm are suited for fresh wood, while the finer teeth at 14 teeth per 30 mm are a better fit for frequently sawing hard or seasoned wood types, like most fruit trees.

THE SUPER ACCEL

THE SUPER ACCEL

If you prioritize ultralight over everything else, the Super Accel is your pick. At only 195 grams, this lightweight aluminum saw is only matched by its speed. The Super Accel is designed with an angle of approximately 10 degrees between handle and blade, which makes every cut require less force, minimizes vibrations, and increases speed.

Gardeners and outdoor users alike love this saw. Whether they bring it with them in a Gomcase or with a rope or carabiner through the hole in the handle, it is a saw to always have on hand.

The Super Accel comes with two teeth choices. The large teeth option has 7.5 teeth per 30 mm, making it rip through fresh wood. The fine teeth option has 14 teeth per 30 mm and is better suited for hard or seasoned wood, like most fruit trees.

THE ULTRA ACCEL

THE ULTRA ACCEL

The Ultra Accel with straight blade is compact and makes a fast and straight up cut with precise control. The straight blade is easy to handle in densely grown spaces and on a flat surface.

The curved blade of the Ultra Accel Curve bites aggressively into the wood and helps you to keep the saw in the cut. Also, a curved blade is easy to handle when pruning above shoulder-height.

The large teeth of the Ultra Accel and Ultra Accel Curve are great for general pruning work in mostly fresh wood. With the locking mechanism you can securely lock the blade in two different sawing positions.

The large handle is made of lightweight aluminum and covered with thick rubber for a safe and comfortable grip. The hole in the handle gives the possibility to attach a carabiner or rope to the saw.

THE
GOMBOY

@EPICUREAN_FOLK

@GILES__NEWMAN

THE
GOMBOY

The Gomboy is a favorite for a reason. It is a multifunctional saw that can go from pruning in a garden to creating a shelter in the woods. The medium sized teeth at 10 teeth per 30 mm saw through fresh wood and dead or dried wood with ease. The rubber handle ensures a safe and comfortable grip and the hole in the handle makes it easy to attach a piece of rope or a carabiner to the handle. Folded, the teeth are protected, so it can be tossed in a backpack for a multi-day trek. The multifunctional Gomboy can be used anywhere!

This compact saw packs a punch and comes in a variety of sizes. Larger sizes are suited for larger branch diameters. A good rule of thumb is the blade can handle branches of half the blade length in diameter.

THE GOMBOY CURVE

@PADRAIGCROKE

THE GOMBOY CURVE

Look for the yellow color of the handle in the Gomboy family to see the Gomboy Curve editions. The yellow rubber handle absorbs vibrations and has a comfortable grip, even when wet. It also protects the blade when folded into the handle.

The large teeth, 8 per 30 mm, rip through fresh wood with extra aggressive power due to the curved blade. The saw is great for working above your shoulders and below your knees.

The Gomboy Curve comes in four different sizes. We suggest choosing a more compact model for regular pruning, such as the blade lengths of 210 or 240 mm. Larger sizes are suited for larger branch diameters. A good rule of thumb is the blade can handle branches of half the blade length in diameter.

THE WOODBOY

THE WOODBOY

The Woodboy family is defined by extremely fine teeth on the blades, the finest available in the Silky Wood Saws range. These very fine teeth leave the smoothest possible cut. It also has a lightweight handle that is comfortable to hold, reduces vibrations, and offers superior grip. The blade folds into the handle for protection. The locking mechanism on the handle makes it possible to use the saw in two positions. The second position raises the handle to make it easier to saw on a flat surface.

There are two standard Woodboy options with the Kataba model, one with 26 teeth per 30 mm and the other with 32 teeth per 30 mm. Both the 26 teeth per 30 mm and the 32 teeth per 30 mm will leave behind exceptionally smooth cuts.

THE OUTBACK SERIES

@OLD_SWELL

@GOIN.SOLO

THE OUTBACK SERIES

Silky has developed a completely new line of folding saws, specially designed for outdoor and hunting. The Outback series includes a Pocketboy, Gomboy Curve and Bigboy 2000. The blade can be locked in two positions and when not in use, you can fold it so that the sharp teeth are completely covered in the handle. The Pocketboy and Gomboy include a transparent case, the Bigboy comes with a nylon carrying case.

They all feature a black coating of a unique nickel and tin blend on their blades, including the teeth. This provides a long blade life and an incredible cutting performance, not only in wood but also when sawing bones. In addition, the dark, non-reflective color makes these saws particularly suitable for tactical operations.

The arbor composite handles have a warm and comfortable touch. No matter the cold or wet conditions, this handle offers a safe grip and superior control.

THE POLE SAWS

Pruning at high altitudes, but then safely with both feet on the ground. Silky's telescopic pole saws are lightweight and easy to use. Just place the blade on top of a branch and let the saw do the work. Due to gravity and the pulling movement, no force is needed.

With the oval shape of the aluminum pole you have a very precise control over the direction of the blade. Moreover, this shape gives more strength and rigidity over the full length and reduces bending to a minimum.

Pole saws are available in several series and lengths. All models have a dual locking mechanism, consisting of pushbuttons and levers. Together they create the safest and most stable locking of the preferred pole length.

THE LONGBOY

@ARBORES.ES

THE LONGBOY

If you often take a pole saw with you in the cherry picker or car, then the Longboy was especially made for you! Because the blade is collapsible, the Longboy has a retracted length of just 145 cm. With the cover, the blade can be fastened to the pole, so that this compact pole saw can be safely and easily carried, transported and stowed.

You could easily prune trees all day long without getting tired, because the Longboy is lightweight and easy to handle. The sickle at the end of the blade helps you to keep the blade in the sawing cut. You can also use the sickle to cut little twigs off the trunk or to pull little (dead) branches from the tree.

THE HAYATE

THE HAYATE

A real heavy duty tool specially for professionals. The Hayate consists of a heavier construction than the Hayauchi, which makes this telescopic pole saw even more robust. The blade has Silky's unique Mirai-Me teeth and two sickles. The upper sickle keeps the blade in the sawing cut, while the lower sickle makes it easy to undercut bark. The lower sickle is detachable.

Choose from four different extended lengths. The Hayate 7700 is Silky's longest pole saw and allows you to prune up to 9 meters high in the tree. The aluminum pole is oval-shaped, giving you precise control over the direction of the blade. It also has two locking mechanisms to create a safe and stable pole in your preferred length.

THE HAYAUCHI 480

@JONATHANDUMONT.BE

THE HAYAUCHI 480

If you want the maximum amount of power, there is an option for the Hayauchi to come equipped with a 480 mm blade. This larger blade can handle branches up to 240 mm in diameter with incredible speed. The extra-large teeth glide through branches and leave behind smooth cuts.

All this extra power comes without sacrificing all the features of the Hayauchi that make it so popular. The oval-shaped aluminum pole gives you precise control over the direction of the blade and the two locking mechanisms create a safe and stable pole in whatever length you want to work at.

The detachable sickle can be used to make undercuts and also to pull dead branches from the tree.

THE AXES

Chopping wood is sometimes faster and easier than sawing. When you don't need the accuracy of a Silky saw, some jobs can be better done with an axe. Think of debarking, snedding, layering hedges or brush clearing.

Silky axes are made from Authentic Premium Japanese Steel and are characterized by a superior finish. Using this tool as a hatchet or a knife, you are always assured of a good grip. All models have a full tang blade and are provided with Silky's Genki grip.

This handle is made of just two rubber parts and can easily be zipped off the blade without the use of tools. Vibrations are maximally damped to work safely and comfortably.

THE NATA

THE NATA

In some cases, chopping is faster than sawing or cutting. The Nata is the best of a knife and axe in one tool. There are 4 different lengths and 2 different blade types available. All models include a scabbard with belt clip for easy carrying.

The Nata Single Edge is sharpened on one side of the blade and very suitable for chopping small branches, debarking trees and layering hedges. The Nata Double Edge is sharpened on both sides of the blade, making it very suitable for splitting wood.

The full tang blade, made of special alloy steel, runs through the handle in a slight angle for a perfect stroke. The comfortable Genki grip consists of two rubber parts that encase the steel without any screws or bolts, providing the best grip and maximum absorption of vibrations.

THE NATA OUTBACK

THE NATA OUTBACK WILL BE EXPECTED
AT SELECTED BUSHCRAFT & OUTDOOR
PARTNERS IN SPRING 2023

THE NATA OUTBACK

Silky introduces the Nata Outback, the ultimate axe for outdoor users. This special edition of the Nata 240 Double Edge features Silky's latest technology: Black Oxide coating. Through a special oxidation process, the blade gets its deep black color, which is particularly suitable for tactical operations. In addition, this finish offers extra protection against rust for the best chopping performance.

The Nata Outback is complete with Silky's Genki grip and a matching dark scabbard with belt clip for safe storage and easy carrying. The full tang blade runs through the comfortable handle in a slight angle for a perfect stroke. Because the blade is double sharpened, this axe is particularly suitable for making your shelter, splitting wood or batoning. Just what you need for campfires and outdoor cooking.

THE ONO

THE ONO

This European-style axe is characterized by its full tang blade and superior nickel plated finish for smooth chopping and debarking. The Ono is exceptionally well balanced and its 12 cm double ground blade offers many possibilities for camping and bushcrafting.

Because the blade runs through the handle, this axe feels robust and sturdy and offers great control. The steel is encased by Silky's Genki grip, consisting of just two rubber parts without any screws or bolts. The handle can easily be zipped off the blade without the use of any tools and vibrations are maximally damped.

The Ono comes with a durable nylon sheath to protect the blade, and your fingers. The hole in both the handle, blade and the sheath makes it easy to secure or hang this tool.

THE MERCHANDISE - AND ACCESSORIES -

Accessories are the finishing touches to your saw. A rubber holster to always have your folding saw at hand, a pair of leg straps to attach the scabbard of your fixed saw to your leg or a HookFox to mount on your pole saw and pull branches out of the tree. All these accessories make pruning easier and more fun.

For the Silky fans there are several merchandise items available. A small giveaway can be a big gesture. You can dress yourself up in Silky clothes and for those who prefer to be less conspicuous, Silky has nice little gadgets.

@CANOPYCLIMBINGCOLLECTIVE

SILKY MERCHANDISE

SILKY MERCHANDISE

Silky clothing is for everyone. The polo's have a regular fit and are made from 60% cotton and 40% polyester. The T-shirts are available in men's and women's models. They have a regular fit and are made from 100% organic cotton.

For less tropic conditions, Silky provides soft shell jackets and hoodies. A soft shell is a smooth, comfortable jacket that is windproof, water-repellent and also breathable. The inside is made of fleece to keep you warm. The jacket is clearly visible with the reflective piping on the front and the back and has several storage options with two side pockets, one on the chest and one on the arm.

Our comfortable Silky hoodie with pouch pocket is made of 85% cotton and 15% polyester (E.R.S. certified). The hoodie is finished with nice little details, like an embroidered Silky logo on the chest and a small Silky fox on the board. A real musthave for every Silky fan!

SILKY ACCESSORIES

@BUSHCRAFT_ALLI

SILKY ACCESSORIES

Folding saws can be stored in a strong and flexible rubber holster. Attach it to your belt and you always have your saw at hand. There are several models available, depending on the size of the saw. The Gomcase for the Bigboy is the largest one and made of polypropylene instead of rubber. In the Gomcase W double you can put your folding saw and secateurs together for all the pruning work.

When the teeth of a Silky saw are not induction hardened, they can be filed with the special Silky file. The teeth are ground in 4 angles, so the filing is very precise. Check www.silky-europe.com for more information. Saw blades with induction hardened teeth can be replaced.

The HookFox is suitable for the Hayauchi, Hayate, Longboy, Forester and Zübat pole saws. It can be used to pull down dead or cut branches which remain hanging in the tree or to lift a climbing rope up over a branch.

With the Silky leg straps you can attach the scabbard of a fixed saw to your leg. This is often done by tree climbers so they can easily grab the saw while being in difficult positions.

POLE SAW PARTS

Silky saws are made to last a long time. By all means, it can happen that a part wears, breaks or gets lost. At that point it is nice that you do not have to buy a whole new saw and can just replace a part.

Compared with an ordinary saw, a pole saw consists of quite a few parts. Take a look at the spare parts drawings, literally all small parts are separately available. That makes a Silky saw always a sustainable choice.
